

Introduction to Hostinger API SDKs

 hostinger.com/support/11080244-introduction-to-hostinger-api-sdks

migration

April 14, 2025

Hostinger provides official SDKs to simplify interaction with our API, making it easier and faster for developers to integrate Hostinger services into their applications. Currently, we offer SDKs in the following languages:

- [PHP SDK](#)
- [Python SDK](#)
- [TypeScript SDK](#)

Getting Started

PHP SDK

To install the bindings via [Composer](#), add the following to `composer.json`:

```
{
  "repositories": [
    {
      "type": "vcs",
      "url": "https://github.com/hostinger/api-php-sdk.git"
    }
  ],
  "require": {
    "hostinger/api-php-sdk": "*"
  }
}
```

Then run `composer install`.

Example usage:

```

<?php
require_once(__DIR__ . '/vendor/autoload.php'); // Configure Bearer authorization:
apiToken
$config = Hostinger\Configuration::getDefaultConfiguration()-
>setAccessToken('YOUR_ACCESS_TOKEN'); $apiInstance = new Hostinger\Api\BillingCatalogApi(
    // If you want use custom http client, pass your client which implements
    `GuzzleHttp\ClientInterface`.
    // This is optional, `GuzzleHttp\Client` will be used as default.
    client: new GuzzleHttp\Client(),
    config: $config
); try {
    $result = $apiInstance->getCatalogItemListV1();
    print_r($result);
} catch (Exception $e) {
    echo 'Exception when calling BillingCatalogApi->getCatalogItemListV1: ', $e-
>getMessage(), PHP_EOL;
}

```

Python SDK

Install via pip:

```
pip install hostinger_api
```

Example usage:

```

import hostinger_api
from hostinger_api.rest import ApiException
from pprint import pprint # Configure Bearer authorization: apiToken
configuration = hostinger_api.Configuration(
    access_token = os.environ["BEARER_TOKEN"]
) # Enter a context with an instance of the API client
with hostinger_api.ApiClient(configuration) as api_client:
    # Create an instance of the API class
    api_instance = hostinger_api.BillingCatalogApi(api_client)    try:
        # Get catalog item list
        api_response = api_instance.get_catalog_item_list_v1()
        print("The response of BillingCatalogApi->get_catalog_item_list_v1:\n")
        pprint(api_response)
    except ApiException as e:
        print("Exception when calling BillingCatalogApi->get_catalog_item_list_v1: %s\n" %
e)

```

TypeScript SDK

Install via npm:

```
npm install hostinger-api-sdk@0.0.4 --save
```

Example usage:

```
import { Client } from 'hostinger-api-sdk'; const client = new Client('your-api-token'); client.get('/v1/user').then(response => {  
  console.log(response);  
});
```

Authentication

All SDKs require an API token to authenticate your requests. You can obtain your API token from your Hostinger dashboard under [the API in Account settings](#).

Explore our SDKs' functionalities and advanced features by checking out their respective GitHub repositories linked above.
